

HYPHER RAMAN EFFECT

Light source

POLARIZATION

Unpolarised light

Polarising filter

Polarised light

Introduction to Nonlinear Optics

$$P(E) = \chi_L E + \chi^{(2)} E E + \chi^{(3)} E E E + \dots$$

Linear term

Nonlinear corrections

Example of second-order effect: second harmonic generation (Franken 1961):

Symmetry restriction for second-order processes

Hyper Raman Effect

- Scattered Radiations at different frequencies
- Three photon process

Hyper Raman and Surface-Enhanced Hyper Raman Spectroscopy

With focused, pulsed laser, you can induce a non-linear interaction:

$$\mu_{ind} = \alpha \vec{E} + \frac{1}{2} \beta \vec{E} \cdot \vec{E} + \frac{1}{6} \gamma \vec{E} \cdot \vec{E} \cdot \vec{E} + \dots$$

Incident: ν_0

Scattered: $2\nu_0, 2\nu_0 \pm \nu_1$

Selection Rules:

All IR active modes are also hyper-Raman active
Some hyper-Raman active modes are neither IR
or Raman active

Hyper Raman Scattering Selection Rules

- All Infrared – Active bands are Raman active
- All Raman active bands are not Hyper Raman active
- Vibration which are both Infrared and Raman active are Hyper Raman active
- Hyper Raman active vibrations which are IR active are always polarized

Classical Treatment of Hyper Raman Effect

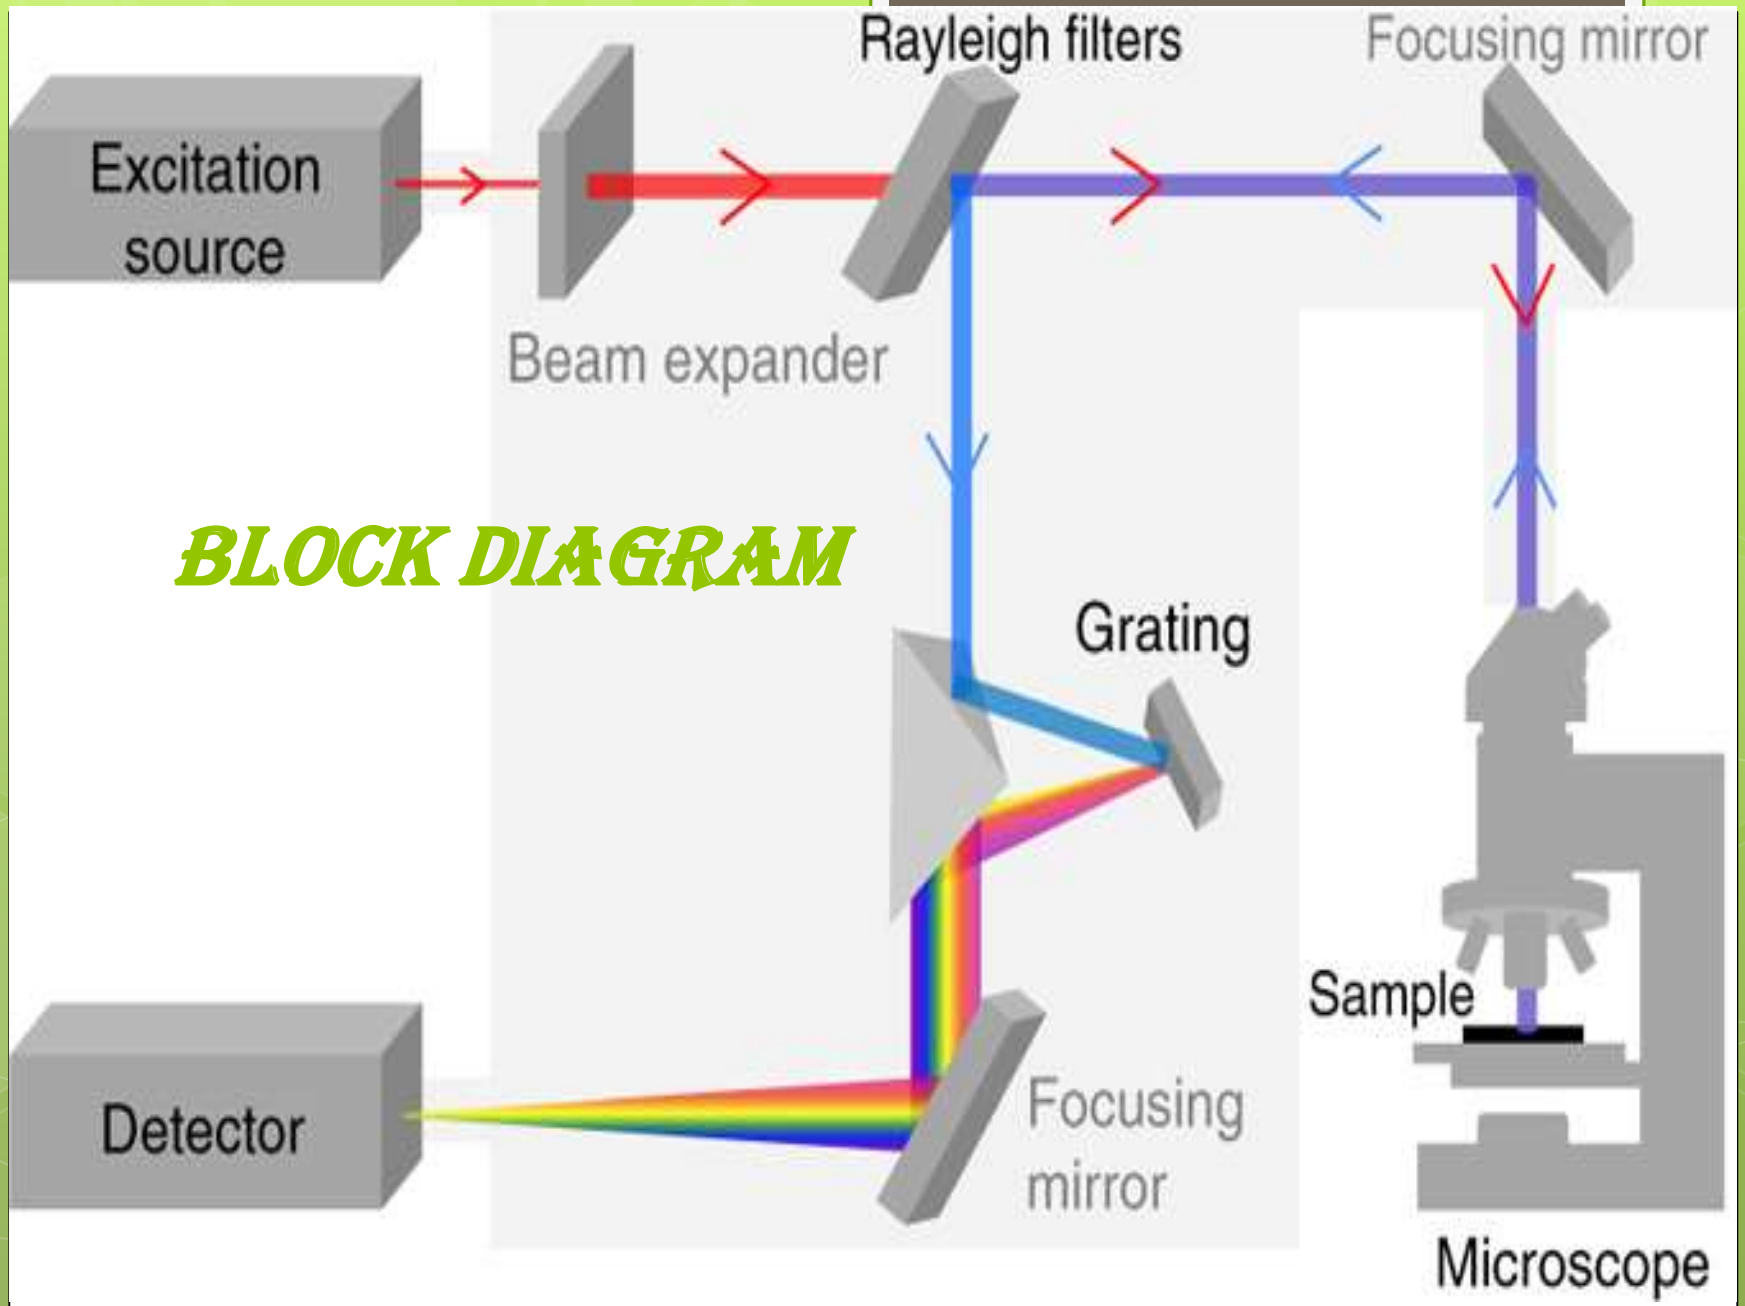

- Findings of Eight Distinct Frequency Components
- Effect of Non-Linear Susceptibility

RAMAN SPECTROMETER

Experimental Techniques for Hyper Raman Effect

- Single Channel and Multi Channel Detection
- Block Diagram of Multichannel Raman Spectrometer

Thank
you
