# CDMPLEMENTARY CHEMISTRY COURSES SEMESTER - I 15UILPCHEI: GENERAL CHEMISTRY (Cammon to Physical sciences and Life sciences) 

## Concept of Equilibrium

Maria Linsha P.L<br>Department of Chemistry<br>Sacred Heart College

## Properties of Acids and Bases

What are the properties of acids and bases?

## Acids

Acids taste sour, will change the color of an acidbase indicator, and can be strong or weak electrolytes in aqueous solution.

Bases taste bitter, feel slippery, will change the color of an acid-base indicator, and can be strong or weak electrolytes in aqueous solution.

## Arrhenius Acids and Bases

## How did Arrhenius define an acid and a base?

- Arrhenius said that acids are hydrogen-containing compounds that ionize to yield hydrogen ions $\left(\mathrm{H}^{+}\right)$in aqueous solution. He also said that bases are compounds that ionize to yield hydroxide ions $\left(\mathrm{OH}^{-}\right)$in aqueous solution.

## Hydrochloric Acid

| Hydrogen |
| :---: |
| chloride |

| Hydrogen |
| :---: |
| ion |
| (hydrochloric acid) |
| ind |
| ind |

Hydrogen chloride

- Arrhenius Bases
- Hydroxide ions are one of the products of the dissolution of an alkali metal in water.

# Brønsted-Lowry Acids and Bases 

## What distinguishes an acid from a base in the Brønsted-Lowry theory?

- The Brønsted-Lowry theory defines an acid as a hydrogenion donor, and a base as a hydrogen-ion acceptor.

## Conjugate Acids and Bases

- A conjugate acid is the particle formed when a base gains a hydrogen ion.
- A conjugate base is the particle that remains when an acid has donated a hydrogen ion.

- A conjugate acid-base pair consists of two substances related by the loss or gain of a single hydrogen ion.

- A substance that can act as both an acid and a base is said to be amphoteric.

## Lewis Acids and Bases

## How did Lewis define an acid and a base?

- Lewis proposed that an acid accepts a pair of electrons during a reaction, while a base donates a pair of electrons
- A Lewis acid is a substance that can accept a pair of electrons to form a covalent bond.
- A Lewis base is a substance that can donate a pair of electrons to form a covalent bond.

$$
\mathrm{H}^{+}+\underset{\substack{- \\
\text { Lewis } \\
\text { acid }}}{\begin{array}{c}
\text { Lewis } \\
\text { base }
\end{array}}
$$

| Acid-Base definitions |  |  |
| :--- | :--- | :--- |
| Type | Acid | Base |
| Arrhenius | H+ producer | OH-producer |
| Brownsted-lowry | H+ donor | H+ acceptor |
| Lewis | Electron pair acceptor | Electron pair donor |

## Strong and weak acids and bases

- Strong acid - fully dissociates in water, i.e. almost every molecule breaks up to form $\mathrm{H}^{+}$ions
- Some strong acids are $\ldots \mathrm{HCl}, \mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{HNO}_{3}$
- Weak acid - partially dissociates in water
- Some weak acids are...carboxylic acids such as $\mathrm{CH}_{3} \mathrm{COOH}$, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}$
- Strong base - fully dissociates in water, i.e. almost every molecule breaks up to form $\mathrm{OH}^{-}$ions
- Some strong bases are.... NaOH , compounds which contain $\mathrm{OH}^{-}$ ions or $\mathrm{O}^{2-}$ ions
- Weak base - partially dissociates in water
- Some weak bases...nitrogen-containing compounds, such as $\mathrm{NH}_{3}$
- Strenaths can he determined hy the acid or hase dissociation

## Acids

- Act as proton donors
- Electron pair acceptors
- Strong acids dissociate fully in water.
- Weak acids partially dissociate.
- $\mathrm{K}_{\mathrm{a}}$ : acid dissociation constant

$$
\begin{gathered}
\mathrm{HA}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{A}^{-} \\
\mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}
\end{gathered}
$$

- Higher $\mathrm{K}_{\mathrm{a}}$ values mean stronger acids

## Bases

- Act as proton acceptors
- Electron pair donors
- Strong bases dissociate fully in water
- Weak bases partially dissociate
- $\mathrm{K}_{\mathrm{b}}$ : base dissociation constant

## pH and pOH

- $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$can vary greatly $\Rightarrow$ logarithmic scale used
- $\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$
- $\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$
- $\mathrm{pH}>7$ basic
- $\mathrm{pH}=7$ neutral
- $\mathrm{pH}<7$ acidic
- Can also express dissociation constants in terms of logs:

$$
\mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}
$$

- $\therefore$ the higher the $\mathrm{K}_{\mathrm{a}}$ the lower the $\mathrm{pK}_{\mathrm{a}}$
- Similarly for bases

## Ionic product of water

$$
2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}
$$

$\mathrm{K}_{\mathrm{w}}$ is the ion-product constant. $\mathrm{K}_{\mathrm{w}}$ is the product of the molar concentrations of $\mathrm{H}_{3} \mathrm{O}^{+}$and $\mathrm{OH}^{-}$ions at a particular temperature

$$
\begin{gathered}
\mathrm{K}_{\mathrm{w}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{H}_{2} \mathrm{O}^{2}\right.} \quad\left[\mathrm{H}_{2} \mathrm{O}\right] \text { is constant } \\
\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=1.0 \times 10^{-14} \text { at } 25^{\circ} \mathrm{C} \\
\\
\\
\\
\left.\mathrm{pK}_{\mathrm{w}}=-\log \mathrm{H}_{3} \mathrm{O}_{\mathrm{w}}\right]=\left[\mathrm{OH}^{-}\right] \\
\\
\\
\\
\\
\left.\mathrm{H}_{3} \mathrm{O}^{+}\right]>\left[\mathrm{OH}^{-}\right] \text {Solution is neutral } \\
\\
{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]<\left[\mathrm{OH}^{-}\right] \text {Solution is acidic basic }}
\end{gathered}
$$

- Can incorporate pH and pOH

$$
\begin{gathered}
\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right] \quad-\log \mathrm{K}_{\mathrm{w}}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right] \\
\mathrm{pK}_{\mathrm{w}}=\mathrm{pH}+\mathrm{pOH}=14\left(\text { at } 25^{\circ} \mathrm{C}\right)
\end{gathered}
$$

## Buffers

- Allow pH to be maintained over small additions of acid or base
- Made up of a weak acid and its conjugate base, e.g.

$$
\mathrm{HA}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{~A}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}
$$

acid conjugate base

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{a}}=\frac{\left\lfloor\mathrm{A}^{-} \| \mathrm{H}_{3} \mathrm{O}^{+}\right]}{\mathrm{HA}} \\
& {\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\mathrm{K}_{\mathrm{a}}\left(\left[\begin{array}{c}
{[\mathrm{HA}]} \\
{\left[\mathrm{A}^{-}\right]}
\end{array}\right)\right.} \\
& -\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\operatorname{logK} \mathrm{a}^{-}-\log \left(\frac{[\mathrm{HA}]}{\left[\mathrm{A}^{-}\right]}\right) \\
& \mathrm{pH}=
\end{aligned} \mathrm{pK}_{\mathrm{a}}+\log \frac{\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]} .
$$

- The equilibrium will shift to the right on addition of a small amount to base and shifts to the left on addition of small amounts of acid
- Henderson-Hasselbalch equation allows determination of pH in buffer systems:

## Solubility Equilibria

- Solubility Product Expression and $K_{\text {sp }}$
- $K_{\text {sp }}$ is the solubility product constant
- Set up like other equilibrium expression
- General example;

$$
\begin{aligned}
\mathrm{MX}_{n}(s) & \rightleftarrows \mathrm{M}^{\mathrm{n}+}(a q)+n \mathrm{X}^{-}(a q) \\
K_{\mathrm{sp}} & =\left[\mathrm{M}^{n+}\right]\left[\mathrm{X}^{-}\right]^{n}
\end{aligned}
$$

- Solids and liquids are not included in equilibrium expressions

## The Common Ion Effect

- When a compound containing an ion in common with an already dissolved substance is added to a solution at equilibrium, the equilibrium shifts to the left.
- This phenomenon is known as the common ion effect.
- Produced by the addition of a second solute.
